

Kommunicate UI Developer Test

1. Design the below screen using HTML and CSS, without using any external libraries.

Code: [Question1](#)

Output:

2. Complete the following JavaScript function that accepts the URL and the parameter name and returns the value of that parameter.

Code: [Question2](#)

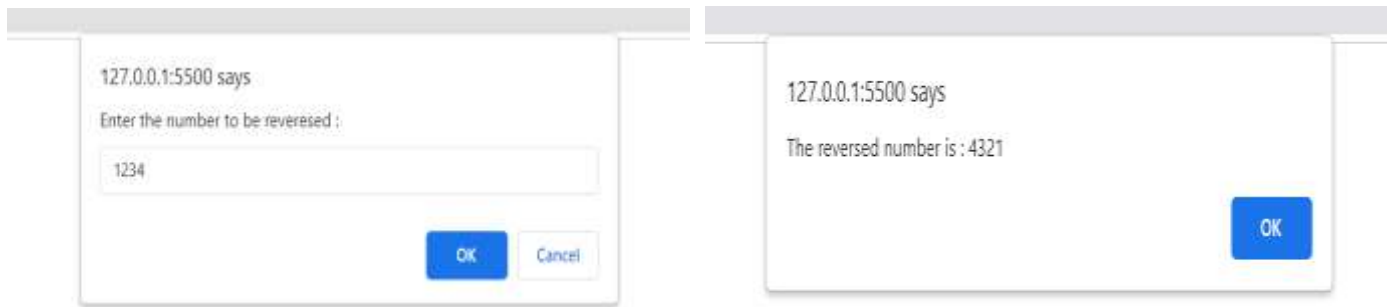

Output:

3. Write a JavaScript function that prints the reverse of a number. Example: if the number is 149, then output should be 941.

Code: Question-3

Output:

Question-3

The number entered is : 1234

The reversed number is : 4321

4. Describe the best project you have worked on, including links if any.

The title of the project is “Restaurant Management System”. The main objective of this project is to explore the opportunities, challenges and the conditions that could lead in building a successful website. The simplicity and ease of accessing the menu and booking a table or a room makes it easier for the diners to flip, swipe and tap through the menu. Here, I aim to provide the menu, rooms and table-bookings which are highly recommended by many national and international restaurants. Using this system, we can find customers' desires easily and its paperless system reduces the workload. Once the customers fill the form, the data will be stored in the database and the administrator will have the access to it. The data will be saved in the database with complete security and the customer can directly visit the restaurant based on the date and time they reserved.

5. If you are to start a software company, name 2 people from your batch whom you will choose as your partner and why?

Firstly, if I start a software company, I would give opportunity to many people who are best fit for the role.

If I consider choosing partners from my batch, I would choose Vamsee and Girish, two of my friends from our batch. The reason for choosing them is, Vamsee has very good Problem-Solving skills which can be utilized for coming up with innovative ideas whenever the company dumps into an issue. At that time his critical thinking skills and the way he approaches the problem induces the efficient solution which is very important while starting a software company.

Girish has good Front-end development skills that are very useful for promotional activities and creating official website for the company. He is also proficient in many new tech stacks. His communication skills will uplift the company in the global market and adds a value to the requirements.
